Hi,

I have a github environment setup. This environment is called "live".

Within this environment, I have a variable setup called "MY_VARIABLE". This has a value of "THIS IS A TEST!".

In my yml, I can confirm that I am using the correct environment:

jobs:

variables:

runs-on: ubuntu-latest

environment:

name: live

In my makefile, I want to be able to use MY_VARIABLE from github. How do I do this?

I have tried stuff like:

MY_VARIABLE = vars.MY_VARIABLE

But that doesn't seem to work.

The deliverable is a valid makefile, that uses the value from the github environment. First one to submit code that updates the makefile correct, will get the contract and a 5 star review.

Thank you!
